Making a difference...together

Saanich Peninsula Stormwater Quality

2021 Program Report

INTRODUCTION

The Capital Regional District (CRD) Stormwater Monitoring Program works to identify and reduce contamination from the land into stormwater and surface water (creeks and the ocean). CRD staff, in cooperation with municipalities and First Nations, accomplish this through environmental monitoring, assessment, collaboration and education. This work meets commitments in the Saanich Peninsula Liquid Waste Management Plan (LWMP; CRD, 1996), described below.

CRD staff monitor stormwater discharges and creeks to identify contamination and impacts from stormwater due to various land use practices. Staff assess approximately 300 stormwater discharges on the Saanich Peninsula and assign priority ratings for mitigative action by the appropriate jurisdiction. When contamination is found, CRD staff conduct investigations and work with municipal staff to identify sources of contamination.

This report summarizes the results of work completed in 2021 (2022 data was considered when available). Data, sampling locations and details about the CRD stormwater discharge rating methods for public health and environmental concern are available in appendices A through G.

Regulatory Background

The CRD created the stormwater quality monitoring service to meet commitments in the Saanich Peninsula LWMP. The CRD commitments regarding stormwater quality and management are to:

1. *plan, promote and co-ordinate a program for management of stormwater quality and surface water resources in cooperation with the participating municipalities, communities and local governments to:*

    a. *limit the impacts of stormwater runoff on the environment and public health and well-being*
    b. *protect freshwater and near-shore marine ecosystems and resources*

2. *promote education about water quality issues and to develop educational material*

Municipalities own the stormwater infrastructure and have authority over stormwater under the *Community Charter*[*]. In the LWMP, participating municipalities make the following commitments:

1. *to act on priorities within their jurisdiction to protect stormwater quality, the physical environment and aquatic habitat, and to reduce the levels of contaminants in stormwater discharges to accepted government standards in watercourses and near-shore marine areas*
2. *to use resources available to municipal governments to achieve these reductions*
3. *to amend bylaws, as necessary, to ensure that new development takes place in accordance with appropriate best management practices*

PUBLIC HEALTH

Public Health Concern Ratings

Staff prioritize stormwater discharges annually to meet LWMP commitments and support local governments in directing funds where they will have the greatest benefit. Discharges are prioritized through public health concern ratings, based on the concentration of bacteria in the discharge and the potential for public contact.

[*] https://www.bclaws.gov.bc.ca/civix/document/id/complete/statreg/03026_00

Each year, CRD staff sample a selection of stormwater discharges in the wet and dry seasons for laboratory analysis of *E. coli*, an indicator of sewage or animal waste. The CRD assigns discharges a high public health concern rating if the *E. coli* counts are over 200 colony forming units (CFU)/100 mL on a shoreline used by the public for swimming or diving, or greater than 5,000 CFU/100 mL on a shoreline used by the public for small boating (e.g., kayaking or paddle-boarding). A summary of the CRD rating system is in Appendix G.

In 2021, staff assessed 100 stormwater discharges of which 36 discharges had one or more *E. coli* counts greater than 200 CFU/100 mL, a level that indicates sources of sewage or animal waste with potential to cause adverse effects to members of the public engaging in recreational activities. However, many of these discharges have low flows or are located where there is little risk of public contact. Considering the likelihood for contact, CRD staff assigned the following public health concern ratings:

- 65 low ratings
- 29 moderate ratings, and
- 6 high ratings (Table A, Figure A)

These ratings and the associated bacterial data are listed in appendices B and C. Quality assurance and control data are located in Appendix D.

CRD source investigations indicate that malfunctioning on-site sewage treatment systems or agricultural practices are the sources of bacteria leading to high ratings in three North Saanich discharges and Tseycum Creek. Sources in Sidney are due to sewer cross-connections, illegal dumping and aging infrastructure. The recent repair of a cross-connection has reduced the number of high-rated discharges to two in Sidney. Sidney also recently reported illegal dumping of sewage that was entering into Reay Creek (one of North Saanich's high-rated discharges). CRD staff are working with the municipalities and the Island Health Authority (IHA) to mitigate these sources.

Ratings over Time

Overall, the high-rated discharges appear to be in a decreasing trend on the Saanich Peninsula. The number of high-rated discharges decreased by one in 2021, as staff removed three of the previously high-rated discharges from the list and added two new discharges (Table A).

Staff assigned a lower rating to one discharge that had been high-rated for more than six years. This discharge in Coles Bay (3118) now has lower bacterial levels, due to continued effort from CRD and IHA staff that resulted in on-site treatment system repairs in the catchment.

Four of the high-rated discharges have been of concern for several years. These contaminant sources are challenging to find, difficult to repair, or are the result of agricultural practices.

Table A. Number of Discharges Rated High for Public Health Concern Over Time

Jurisdiction	Number of Discharges Rated High											
	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
Central Saanich	1	2	2	1	1	1	0	0	1	2	1	0
North Saanich	6	4	4	4	3	3	3	4	4	4	3	3
Sidney	4	5	4	5	6	3	2	1	2	2	2	2
Pauquachin First Nation	0	0	0	0	0	0	0	0	0	0	0	0
Tsartlip First Nation	0	0	1	1	0	0	0	0	0	0	0	0
Tsawout First Nation	0	0	1	0	0	0	0	0	0	0	0	0
Tseycum First Nation	1	1	1	1	1	1	1	1	1	1	1	1
Total	**12**	**12**	**13**	**12**	**11**	**8**	**6**	**6**	**8**	**9**	**7**	**6**

Bacterial Source Investigations

CRD, municipal and IHA staff continue to work together to identify bacterial sources in stormwater discharges of concern, so they can be addressed by the appropriate jurisdiction. The sources of contamination include malfunctioning on-site sewage treatment systems, agricultural practices, aging stormwater and sewage infrastructure, sewage-stormwater cross connections, and wild and domestic animals.

In 2021, CRD staff investigated the catchment areas of seven stormwater discharges on the Saanich Peninsula. CRD and Sidney staff found and repaired a cross-connection in discharge 450. CRD staff are currently investigating another source in that discharge. Two of the high-rated discharges (3118B in Coles Bay and 3078A in Deep Cove) drain areas that use on-site sewage treatment. CRD staff have narrowed down the sources and passed the information onto IHA for follow-up. Tseycum Creek (3095) has been rated high for more than 10 years, due to agricultural practices upstream in North Saanich.

Staff continued to narrow down the sources of bacteria in the other catchments using upstream sampling for parameters such as bacteria, caffeine and genetic analysis (to determine if the origin of the bacteria is animal or human. See Table B for status of investigations). Staff will continue investigations in many of these stormwater catchments, and others that are a concern, in 2022.

Table B. Status of 2021 Source Investigations

Stormwater Discharge #	Location/ Jurisdiction	# of Visits	Status	Next Steps
412	Tetayut Creek Central Saanich	1	Complete; conducted due to odour complaints following heat wave but no indication of sewage inputs to creek.	CRD to continue investigation if complaints arise again.
450	Sidney	3	Source found and repaired. Other sources exist.	CRD to continue investigations for other sources.
3005	Mermaid Canal	2	Inconclusive; elevated metals in water upstream but lower upon resampling.	CRD to continue investigations.
3118B	Coles Bay, North Saanich	1	Source narrowed and passed onto Island Health.	CRD to continue monitoring.
3145	Brentwood Bay, Central Saanich	1	Inconclusive; narrowed down to a couple blocks; discharge dry in summer Human bacteria measured from two directions.	CRD to continue investigation.
3079	Tatlow Creek, North Saanich	2	Narrowed, confirming source; human source confirmed but counts lower upon resampling.	CRD to continue investigation.
3133	Hagan Creek, Central Saanich	3	Main source identified; sampling for another source resulted in low counts.	Waiting for repairs to main source.

Coles Bay

CRD staff continues to work with Island Health, North Saanich and Pauquachin First Nation to find and eliminate sources of bacteria in stormwater going into the bay. Two sources have been identified in recent years and bacterial counts have decreased in both, however, other sources from malfunctioning onsite sewage treatment systems remain.

ENVIRONMENTAL CONCERN

The CRD assesses environmental concern in water and sediment from stormwater, pipes, ditches and streams, based on their potential to impact the marine receiving environment. Staff also assess watercourse health in seven freshwater streams through water quality and benthic invertebrate sampling. When contamination is found, the results are passed onto the appropriate jurisdiction and the CRD works in partnership to find and eliminate the source.

Chemical Contaminant Sampling

Sediment

The program evaluates sediment from within stormwater discharges (pipes, ditches and streams) for potential environmental impact due to contaminant levels. Sediment data and ratings are in Appendix E.

CRD staff assign contaminant ratings to stormwater discharges from sediment samples taken at the point of discharge into the marine environment. Ratings are determined by comparing the concentration of each contaminant [eight metals and high and low molecular weight polycyclic aromatic hydrocarbons (PAH)] to sediment quality guidelines protective of marine life. Methods are described in Appendix G.

2021 Monitoring Results

Staff collected 10 sediment samples on the Saanich Peninsula, 8 at the point of discharge (to measure potential contamination to the marine receiving environment), and 2 upstream in Reay Creek (to assess sediment contamination in the upper watershed).

Staff assigned the following contaminant ratings to the 8 discharges assessed in 2021:

- 4 low ratings,
- 4 moderate ratings, and
- 0 high ratings

Discharges Requiring Corrective Action

Remedial work resulted in decreased contamination in two of the three discharges that have been a concern for many years, allowing removal from the list of discharges requiring corrective action. The data indicates lower levels of contaminants in discharges 441 (Reay Creek) and 3138 (Tsartlip Boat Launch).

Only one discharge remains on the list of discharges requiring corrective action: Mermaid Creek (discharge 3005). Discharge 3005 has been of concern due to elevated metals and PAHs since 2005. Marine sampling results indicate that metals from stormwater may have impacted the marine receiving environment. CRD staff conducted numerous source investigations, however sediment is difficult to find within the infrastructure. Staff has been monitoring water quality instead in recent years.

Previous data has indicated that copper, iron and zinc can be elevated in this discharge, however, copper is the only contaminant elevated above water quality guidelines for protection of aquatic life in 2021. Staff will continue sampling the catchment and will work with the Town of Sidney to determine sources.

Locations of these discharges are shown in Figure A and Appendix A.

Watercourses

Staff continued to monitor Hagan/Graham, ḰEL,SET (Reay), Tetayut, Tatlow (Chalet), ȾEN̲TEN, Tod and Tseycum creeks in 2021, to provide information about creek and watershed health. Each year, staff collect water quality data twice at the discharge of each creek providing a snapshot of creek health in the wet and dry seasons. Approximately every second year, staff conduct more comprehensive monitoring throughout one of the watersheds. This comprehensive monitoring includes more locations within the watershed, additional water quality parameters and collection of benthic invertebrates. In 2021, the Tetayut watershed was sampled in this way. These data are presented in Appendix F.

Based on the CRD monitoring data, the parameters of most concern in Saanich Peninsula creeks are *E. coli*, phosphorus and turbidity, with some creeks also experiencing low dissolved oxygen and elevated metals. Poor water quality is likely the result of development, business waste (historical and ongoing), agricultural practices and malfunctioning on-site sewage treatment systems.

Tetayut Creek Watershed

Staff sampled three locations in Tetayut Creek in the summer and fall of 2021. Samples were collected 5 times in 30 days for both seasons except at Cooperidge Park (sampled during fall only as the creek was not flowing at this location in the summer of 2021).

CRD water quality data in Tetayut Creek indicated that the creek's water quality is somewhat poor and may be decreasing. Comparison to BC ENV water quality guidelines for aquatic life indicated that the levels of *E. coli*, turbidity and total suspended solids, nutrients (nitrate, nitrite and phosphorus) and metals (copper, iron and zinc) are a concern in the creek, particularly during the fall.

These results were similar to the 2015 results (when the creek was last sampled with the same frequency). Differences from 2015 include no exceedances of the cadmium guideline, more exceedances of turbidity and total suspended solids in 2021, and a marginal exceedance of the chronic nitrate guideline at the creek mouth for the first time. Furthermore, the 2021 benthic invertebrate community saw slight decreases in diversity, evenness, Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera (caddisflies) abundance and diversity. The Hilsenhoff Biotic Index also increased from 3.83 (slight organic pollution possible) in 2015 to 5.85 (fairly significant organic pollution) in 2021 indicating an increase in organic pollution in the creek since 2015.

Of note, the region experienced record heat in early summer, a dry summer and then heavy rainfalls in the fall when several atmospheric rivers passed through the region from October to the end of November. The extreme rainfall with a reduction in tree cover in the watershed, may have contributed to the elevated turbidity, suspended solids and metals measured in the fall of 2021. The cause of changes measured in the benthic community are uncertain. Benthic communities can fluctuate from year to year, although the hot, dry summer, loss of tree cover, and increase in percent impervious area in the watershed are possible causes.

In 2022, CRD staff will continue to monitor these creeks and work with First Nations and municipal staff to locate sources of bacterial, physical and chemical contamination.

Quality Assurance

The 2021 data met quality assurance/quality control requirements for the program. For bacterial analysis, quality assurance includes annual establishment of a precision criterion based on a range of Saanich Peninsula stormwater sample triplicates. Staff collect blanks and field splits for 10% of the discharge and marine surface water samples collected. 5 of the 34 field splits exceeded the precision criterion; however, the bacterial counts in those samples were low (below 200 CFU/100 mL) and, therefore, not expected to meet the criterion.

Quality assurance for sediment analysis included field duplicates, laboratory triplicates and standard reference materials. Precision and accuracy of the laboratory analysis were estimated from the results of these replicate and standard reference materials samples. A detailed discussion on the quality assurance program is provided in Appendix D.

Saanich Peninsula Stormwater Source Control Service

The CRD established the Saanich Peninsula Stormwater Source Control Service in 2014, with the goal to prevent the release of contamination into the municipal drainage system through education and guidance, maintenance of catch basins, appropriate business practices, and the proper disposal of waste. Since then, staff have focused on creating a regulatory bylaw and its supporting framework. Regulatory bylaws (*Bylaw No. 4168* and amending *Bylaw No. 4229*) that set out the requirements for discharges to the municipal drainage system were finalized in December 2019. The CRD worked with municipalities, stakeholders and dischargers to implement the bylaw in 2019, and expanded implementation strategies in 2020.

Bylaw 4168 Inspections

In 2021, the CRD conducted in-person inspections at 153 businesses to provide education on stormwater source control and solutions for managing business waste on-site to prevent contamination of the stormwater system and the downstream freshwater or marine receiving environment. Inspections took place at 77 parking lot operations, 49 outdoor storage operations, and 27 general inspections.

In addition, staff have collected baseline data in three creeks that drain industrial areas, and sediment sampling continues to identify metal and PAH contamination from parking lots, roads, spills and business waste. Staff anticipate that the environmental monitoring program's sampling results will be used to assess the performance of the stormwater source control program over the coming years.

SAANICH PENINSULA HARBOURS AND WATER MONITORING AND COORDINATION SERVICE

In 2020, a new CRD service was established at the request of the Saanich Peninsula municipalities for the purpose of coordinating and implementing harbours, waterbodies and watercourses environmental protection and improvement initiatives on and surrounding the Saanich Peninsula. The service is to include monitoring, mapping, reporting and public education on issues relating to the marine and shore area environments; coordination and collaboration with public authorities and other persons on issues relating to the marine and shore area environments; and implementing programs related to rehabilitation and improvement of the marine and shore area environments. CRD staff are meeting with municipalities and engaging First Nations to determine next steps.

2022 PROGRAM

In 2022, CRD staff will continue to work with municipal partners, First Nations and the community to achieve LWMP goals to identify stormwater discharges of public health and environmental concern. CRD staff will continue to work with its partners to identify and reduce bacteria and contaminant concentrations in stormwater discharges, creeks and the marine receiving environment.

APPENDIX B

BACTERIAL AND FLOW DATA (2020-2022)

Stormwater Discharge Quality Report

Bacterial and Flow Data (2020-2022)

Station ID	Station Name	Sample Start Date	E. Coli CFU/100 mL	Flow Rate L/min	Sample Comment
SW0405	N of Island View beach parking	2020-07-10	210	65	no odour, very rusty
		2021-01-26	7	< 0.01	no odour, tea colour, light rain previous
		2021-07-19	1700		no odour, amber, no rain, flow not estimated
		2022-03-22	10	> 500	organic odour, tea colour, light rain
SW0407	SA-SU Rd. E corner of Saanichton Bay	2020-09-29	8	50	no odour, slight amber
SW0409CA	Flow from between SA-SU Rd. & Jimmy Rd.	2020-09-29		< 0.01	flow too low to sample
SW0410	20 m N of 2764 SA-SU Rd.	2020-09-29	24	5	no odour, clear
SW0411	Near SA-SU Rd. & Mt. Newton X Rd.	2020-09-29		< 0.01	flow too low to sample
		2021-01-26	20	2	no odour, clear, light rain previous
		2021-07-19		0	dry, no rain
		2022-03-11	< 1	8	no odour, clear, no rain
SW0411A	Across from 2721 Mt. Newton X Rd.	2020-05-28	10	4	no odour, murky brown
		2020-09-29	53	1	no odour, clear
		2021-04-29	3	7	no odour, clear, light rain previous
		2021-07-19		0	dry, not sampled, no rain
		2022-03-11	< 1	11	no odour, clear, no rain
SW0411AA	Between church & 2769 Mt. Newton Rd.	2020-05-28	30	3	no odour, slight amber
		2020-09-29	84	< 1	no odour, clear
SW0412	Tetayut Creek mouth, d/s of Mure Brook	2020-09-29	89	1000	no odour, clear
		2021-01-26	100000	> 1000	no odour, clear, light rain previous
		2021-02-01	400	> 2000	no odour, brown, heavy rain
		2021-07-16	890	> 500	no odour, clear, no rain
		2021-08-10	96	> 250	no odour, clear, no recent rain
		2021-08-17	210	> 250	no odour, clear, no recent rain
		2021-08-24	230	> 300	no odour, clear, no recent rain
		2021-08-31	550	> 300	no odour, clear, no recent rain

Stormwater Discharge Quality Report

Bacterial and Flow Data (2020-2022)

Station ID	Station Name	Sample Start Date	E. Coli CFU/100 mL	Flow Rate L/min	Sample Comment
		2021-09-07	64	> 300	no odour, clear, no recent rain
		2021-10-12	170	> 600	no odour, clear, rain within past two days
		2021-10-20	270	> 2000	no odour, turbid, light rain
		2021-10-26	380	> 3200	no odour, turbid brown, rain
		2021-11-03	150	> 3500	no odour, turbid brown, rain in past two days
		2021-11-09	900	> 3600	no odour, turbid brown, heavy rain previous
		2022-03-11	23	> 2000	no odour, clear, no rain
SW0412-2B	Tetayut Creek, at 2230 Cooperidge Dr.	2021-07-16	80	30	no odour, clear, no rain
		2021-08-10		< 0.01	wet only, no previous rain
		2021-08-17		< 0.01	wet only, no recent rain
		2021-08-24		< 0.01	wet only, no recent rain
		2021-08-31		< 0.01	wet only, no recent rain
		2021-09-07		< 0.01	wet only, no recent rain
		2021-10-12	33	40	no odour, clear, rain within past two days
		2021-10-20	1600	> 250	no odour, very turbid, rain
		2021-10-26	270	> 300	no odour, turbid brown, rain
		2021-11-03	150	> 450	no odour, turbid brown, rain in past two days
		2021-11-09	25	> 450	no odour, turbid brown, heavy rain previous
SW0412-2C	Tetayut Creek, d/s of E. Saanich Rd.	2021-08-17	72	200	no odour, clear, no recent rain
		2021-08-24	40	200	no odour, clear, no recent rain
		2021-08-31	130	250	no odour, clear, no recent rain
		2021-09-07	22	220	no odour, clear, no recent rain
		2021-10-12	20	> 350	no odour, clear, rain within past two days
		2021-10-20	72	> 1000	no odour, turbid, rain
		2021-10-26	320	> 1200	no odour, turbid brown, rain
		2021-11-03	90	> 1500	no odour, turbid brown, rain in past two days
		2021-11-09	38	> 2000	no odour, turbid brown, heavy rain previous

Stormwater Discharge Quality Report

Bacterial and Flow Data (2020-2022)

Station ID	Station Name	Sample Start Date	E. Coli CFU/100 mL	Flow Rate L/min	Sample Comment
SW0412-3	Tetayut Creek, SW of Keating X Rd.	2021-07-16	12	18	no odour, clear, no rain
SW0416	Ferguson Rd. beach access	2020-07-10	11	16	no odour, clear
		2021-01-19	< 1	10	no odour, clear, no rain
		2021-07-09	19	11	no odour, clear, otter in pipe, no rain
SW0420	Arthur Rd. beach access	2022-03-11	< 1	20	no odour, clear, no rain
SW0421A	N of 8055 Arthur Dr., foot of Arthur Dr.	2020-07-10		0	dry, not sampled
SW0422A	Foot of Newman Rd, 3 m N of boat house	2022-03-11		0	dry, not sampled, no rain
SW0424	Between 8475 and 8443 Lochside Dr.	2020-07-10	1	< 1	no odour, slight amber
		2021-01-19	4	40	no odour, clear, no rain
		2021-07-09		0	dry, no rain
		2022-01-17	3	75	no odour, clear, rain previous

		2021-03-02	8	> 2000	no odour, clear, no rain
		2021-04-15	11	> 2000	slight sewer odour, amber, no rain
		2021-09-22	26	80	no odour, clear, light rain prior
		2022-04-07	18	> 4000	no odour, clear, no rain prior

Notes:
Flow is visually estimated
CFU/100 mL is colony forming units per 100 millilitres
u/s is upstream
d/s is downstream
b/t is between

Notes:
Level of Concern determined by the sum of the *E. coli* and shoreline ratings. Low = sums of 2 and 3, moderate = sum of 4 and high = sums of 5 and 6.
EC = *E. coli* counts.
NA = Not rated because it was not one of the discharges assessed this year.
SPSO = This discharge acts as a sewage pump station overflow.

E. COLI SAMPLING QUALITY ASSURANCE AND QUALITY CONTROL PROGRAM FOR 2021

1.0 INTRODUCTION

Quality Assurance and Quality Control (QA/QC) programs are protocols adopted to ensure that results of any study are valid, internally consistent and comparable with similar projects. These protocols are set out in writing and based on current and relevant research on related topics.

Data collected for the quality assurance (QA) program are used to ensure consistency in field handling and analytical methods. If data exceed a specified precision criterion, then the lab is notified of a potential problem in the procedure and steps are taken to resolve the issue.

2.0 METHODS FOR BACTERIAL SAMPLING

All water samples were collected in 250-mL wide-mouth polypropylene bottles supplied by the analytical laboratories (Bureau Veritas Laboratories formerly Maxxam Analytics International Corporation in Victoria). Labelled samples were stored in an insulated cooler with ice packs for protection from prolonged exposure to UV light and delivered the same day to the laboratory. *Escherichia coli* bacteria (*E. coli*) were analyzed following the procedures in Standard Methods (APHA, 1998) and reported as colony forming units per 100 mL (CFU/100 mL).

2.1 Stormwater Discharge Sampling

Where possible, stormwater samples were collected from the point of discharge. Where this was not possible, the stormwater system was followed back to the nearest point where samples could be taken.

2.2 Quality Assurance

2.2.1 Stormwater Sample Replicates (Field Splits)

Ten percent of the total number of samples collected were replicated in the field (field replicates) and are identified in this report as field splits. A single sample was collected in a laboratory-prepared one-litre sample bottle and inverted 30 times to ensure that the sample was homogeneous. The sample was split evenly into two sample bottles. The two bottles were labelled and sent to the lab for analysis as separate samples, but not identified as field splits.

2.2.2 Quality Control Assessment

To establish the precision criteria, 18 replicates (field splits) were analyzed for *E. coli* bacteria. Field splits were collected from six stormwater discharges on the Saanich Peninsula. Discharges were chosen based on previous results, specifically high, moderate or low levels of *E. coli* concentrations. The QA sampling for the assessment was for all *E. coli* samples analyzed by Maxxam. The three levels of *E. coli* concentrations were selected to represent the variance in the samples analyzed during the sampling program. Three grab samples were taken at each of the six stations and split into two replicate sample bottles. Three blank samples of potable water were also collected as part of the assessment. Samples were supplied to the lab with individual numbers.

2.2.3 Calculation of Quality Assurance Results

Laboratory precision for *E. coli* analysis is determined by analyzing several pairs of field samples (field splits). The following procedure is the same as that used for fecal coliforms from Standard Methods, 20th edition (APHA, 1998).

The data are arranged in pairs (D1 and D2). The log of each field measurement is determined (L1, L2) and the difference (range) in the log value between each pair of field splits is calculated: R = (L2 - L1). An average range (Mean-R) is then determined for all of the pairs.

The precision criterion is calculated by multiplying the Mean-R by 3.27 and is rounded to one decimal place.

The log range (R) is calculated for each of the field splits and compared to the precision criterion, to determine whether the sample is acceptable or not, according to the following criteria:

Acceptable (A) If the calculation is less than the precision criterion, then the field data are within normal variability.

Unacceptable (U) If the calculation is greater than the precision criterion, then the field data are outside of the normal variability. Data collected after the last "acceptable" set of data should be discarded and no further analysis should be done until the source of the problem is identified by the lab.

It is important not to put too severe an interpretation on the results, especially when they are close to the "unacceptable" guideline. Each result represents a value within a 95% confidence interval, which gets proportionately larger as the actual result gets smaller. Therefore, one can expect, through randomness, 5% of the samples to be outside of the precision criterion. Also, bacterial counts under 200 CFU/100 mL are considered too small to accurately calculate or compare to a precision criterion (APHA, 1998). It is also important to note that discharges with *E. coli* counts lower than 200 CFU/100 mL receive a low public health concern rating.

The results should be rounded to one decimal place and compared to the precision criterion (e.g., 0.3). If the calculated value from the duplicate results still exceeds the criterion, then an informal investigation of the laboratory should be initiated. If only a few duplicates are unacceptable (i.e., one out of every 20 pairs of duplicates), the lab is probably meeting the guideline.

The overall process is intended to act as an alarm, alerting the study group to potential problems with the sampling and analytical procedures.

3.0 RESULTS

CRD staff collected 18 pairs of stormwater samples from six discharges having high, moderate or low levels of bacteria. Samples were analyzed for *E. coli* concentration used to calculate the precision criterion.

3.1 Blanks

Staff submitted three blank samples (tap water) to the lab for *E. coli* analysis. Blanks were reported as having <1 CFU/100 mL. Therefore, the results meet the QA requirements.

3.2 Precision Criteria

Three of the field splits exceeded the precision criterion, however, these had low results (<200 CFU/100 mL), which are not expected to meet the criterion. In addition, it is expected that 5% of the results will exceed the criterion, due to randomness; therefore, the data are acceptable.

Table 1 shows lab results of the 18 pairs of samples used to determine the precision criterion. The calculated precision criterion was 0.4.

3.3 Field Splits

Table 2 presents results for the field splits collected during the wet period. Data were compared to the precision criterion of 0.4. Three of the field splits exceeded the precision criterion, however, these had low results (<200 CFU/100 mL), which are not expected to meet the criterion. In addition, it is expected that 5% of the results will exceed the criterion, due to randomness; therefore, the data are acceptable.

Table 3 presents results for the field splits collected during the dry period. Three of the field splits exceeded the precision criterion, however, these had low results (<200 CFU/100 mL), which are not expected to meet the criterion. In addition, it is expected that 5% of the results will exceed the criterion, due to randomness; therefore, the data are acceptable.

4.0 CONCLUSIONS

All requirements for the stormwater monitoring QA/QC program were carried out in 2021. All QA/QC results were acceptable for rating stormwater discharges for public health concerns.

Notes:

Concentrations are in mg/kg dry weight.

CRD MSQG = Marine sediment quality guidelines adopted from Washington State's Department of Ecology for protection of aquatic life.

LPAH and HPAH are low and high molecular weight polycyclic aromatic hydrocarbons, respectively.

CCME = Canadian Council of Ministers of the Environment.

ISQG = interim sediment quality guideline; concentrations above this level but below the PEL will occasionally result in adverse effects on aquatic life.

PEL = probable effects level; concentrations above this level will frequently result in adverse effects to aquatic life.

Vancouver Island Background Concentrations are regional estimates (95th percentiles) from BC ENV; https://www2.gov.bc.ca/assets/gov/environment/air-land-water/site-remediation/docs/protocols/protocol_4.pdf

XX Italicized values are those that exceed a guideline but are below the Vancouver Island background concentration.

XX Value is greater than or equal to the CCME ISQG.

XX Value is greater than or equal to the CCME PEL.

XX Value it greater than or equal to CRD MSQG and adverse effects to aquatic life are likely to occur.

For mercury only, the CRD MSQG is lower than the CCME PEL.

Some samples are not collected at the discharge to marine and therefore marine guidelines are not applicable but are used for screening purposes.

Table 2. 2021 Sediment Contaminant Ratings

Station ID	Sample Date	Ratios of Concentration / Marine Sediment Quality Guideline										Sum of Ratios	Contaminant Rating
	Parameter	Arsenic	Cadmium	Chromium	Copper	Lead	Mercury	Silver	Zinc	HPAH	LPAH

Notes:

CRD MSQG = Marine sediment quality guidelines adopted from Washington State's Department of Ecology for protection of aquatic life.

These are ratios of the measured value over the MSQG.

LPAH and HPAH are low and high molecular weight polycyclic aromatic hydrocarbons, respectively.

[redacted]

Some samples are not collected at the discharge to marine and therefore marine guidelines are not applicable but are used for screening purposes

Table 3. Summary of Contaminant Ratings for Environmental Concern

Discharge # (Location)	Figure #	Jurisdiction	Contaminant Ratings							Comments & Recommendations
			2015	2016	2017	2018	2019	2020	2021	
405 (Island View Beach)	4	Central Saanich	-	-	-	Low	Low	-	-	Resample in 2024 to monitor for change.
407 (Saanichton Bay)	5	Tsawout First Nation	-	-	Low	-	-	-	-	Rated low in 2005, 2011 and 2017. Resample in 2022 to monitor for change.
409C (Saanichton Bay)	6	Tsawout First Nation	-	-	-	Low	Low	-	-	Resample in 2024 to monitor for change.
410 (Saanichton Bay)	6	Tsawout First Nation	-	-	-	-	Low	-	-	Elevated lead in 2012. Resample in 2025.
411A (Saanichton Bay)	6	Tsawout First Nation	-	Low	-	-	-	-	Low	Rated low in 2011 and 2016. Rated moderate in 2008. Resample in 2026 to confirm rating.
412 (Tetayut Creek)	7	Tsawout First Nation	Low	Low	Low	-	Low	-	Low	Low at discharge but elevated levels upstream. Resample discharge in 2024 to monitor for change.
416 (Foot of Ferguson Rd)	7	Central Saanich	-	Moderate	-	Low	Low	-	-	Rated low in 1999, 2000 & 2011. Resample in 2024 to monitor for change.
435 (Bazan Bay)	10	North Saanich	-	-	Low	Low	-	-	-	High upstream near highway but low at discharge and in marine. Resample in 2024 to monitor for change.
441 (Reay Creek)	10	North Saanich	High	High	-	-	-	Moderate	Moderate	Remedial action undertaken, continue monitoring.
445 (Foot of Frost Ave.)	11	Sidney	-	-	-	-	-	NR	-	Rated high yearly (2002 to 2007) due to zinc. HPAH elevated in 2005. U/S: 445-2 high in 2007 due to mercury & PAHs. No sediment available since 2009. Elevated copper and zinc in water.
449 (Tulista Park)	11	Sidney	-	-	Moderate	Low	Moderate	Low *	-	Tidally influenced at discharge. Sample 449-2D for rating. *Zn low in sediment, but copper and zinc elevated in one water sample.
450 (Foot of Ocean Ave.)	11	Sidney	-	-	Low	-	-	-	-	Rated moderate in 2005 and 2007 due to cumulative contaminants. Rated low in 2011, 2012 and 2017. Resample in 2022 to monitor for change.
467 (Foot of Shoreacres)	12	Sidney	-	-	Low	-	-	-	-	Resample in 2022 to monitor for change.

Table 3, cont'd

Discharge # (Location)	Figure #	Jurisdiction	Contaminant Ratings							Comments & Recommendations
			2015	2016	2017	2018	2019	2020	2021	
3005 (Mermaid Canal)	13	Sidney	-	-	**High**	-	-	NR	-	Rated high due to Zn & PAH. Marine data >CCME ISQG for Cu, Pb, Hg and Zn. Cu and Zn elevated in water (2020). Elevated As, Cu, Pb and Zn at 3005-3 (2011). Sediment usually not available. **Action Required** (higher priority). Continue source investigations with water.
3006 (Roberts Bay)	13	Sidney	-	-	Low	-	-	-	-	Resample in 2022 to monitor for change.
3016 (All Bay)	14	Sidney	Low	Low	Moderate	Moderate	-	-	Moderate	Rated moderate due to Cu and Zn > CCME ISQG. Upstream arsenic concentrations lower. Sidney flushed line in fall 2015. Resample in 2021.
3021 (Tsehum Harbour)	15	North Saanich	-	-	-	**High**	Moderate	**High**	Moderate	2020: elevated Hg and Pb in sediment; no exceedances in water. Confirm rating.
3077 (Deep Cove)	23	North Saanich	-	-	-	-	-	NR	NR	In 2020, aqueous Cu and Zn 10X above BC ENV marine guidelines, lower in 2021. Pipe buried. Measure aqueous metals. Confirm rating in 2022.
3079 (Tatlow Creek.)	23	North Saanich	-	-	-	Low	-	-	-	Rated low in 2000 & 2008. Resample in 2023 to monitor for change.
3080A (Benes Creek)	24	North Saanich	High	Low	Low	Low	-	-	-	Rated high in 2015 due to mercury; possible lab error. Resample in 2023 to monitor for change.
3090 (Patricia Bay)	26	Tseycum First Nation	-	-	Low	Low	Low	-	-	Rated low in 2001, 2005 & 2010. Resample in 2024 to monitor for change.
3095 (Tseycum Creek)	27	Tseycum First Nation	-	-	Low	Low	-	-	-	Rated low in previous years. Resample in 2023 to monitor for change.
3104 (Tén Tén Creek)	28	North Saanich	-	-	**High**	Moderate High u/s	Low High u/s	-	Low	Zn and Cu above the PEL at Willingdon Road but low at discharge. Transport Canada remediated gross contaminants in the catchment area. Confirm rating.
3118 (Coles Bay)	31	North Saanich	-	-	-	-	-	Low	-	Rated low in 2001, 2005 & 2011. Rated moderate in 2006 and 2008 & 2012. Resample in 2025.
3119 (Coles Bay)	31	North Saanich	High	-	Low	Low	-	-	-	Rated low in 1998, 2004 & 2011. Rated high in 2015 due to mercury; possible lab error. Resample in 2023 to monitor for change.

Table 3, cont'd

Discharge # (Location)	Figure #	Jurisdiction	Contaminant Ratings							Comments & Recommendations
			2015	2016	2017	2018	2019	2020	2021	
3120 (Coles Bay)	31	North Saanich	-	Low	-	-	-	-	Low	Rated low in 1999, 2006, 2011 and 2016. Resample in 2026 to monitor for change.
3122 (Coles Bay)	31	Pauquachin First Nation	High	Low	**High**	Low	Low	-	-	Rated low in past. Rated high in 2015 due to Hg and in 2017 due to Ca. Resample in 2024.
3124 (Coles Bay)	31	Pauquachin First Nation	-	-	-	Low	-	-	-	Rated low in 2001 & 2005. Resample in 2023 to monitor for change.
3133 (Hagan Creek)	35	Tsartlip First Nation	High U/S	-	Low to High U/S	Low to High U/S	Low but High U/S	Low	-	Rated low at point of discharge. Elevated As, Ca, Cr, Cu, Pb and Zn upstream Resample discharge in 2025. Continue investigations around Keating Industrial Park.
3135 (South of Hagan Bight.)	35	Tsartlip First Nation	-	-	Moderate	-	-	Moderate	Moderate	Copper and zinc elevated above CCME PEL. U/S: stations were rated low. Resample in 2026.
3136A (Stream, south of Hagan Bight)	35	Tsartlip First Nation	Moderate	Moderate	-	-	Low	Low	-	No exceedances of guidelines in 2015. Rated high in 2014 due to zinc. Resample in 2025.
3136B (North of Tsartlip boat launch)	35	Tsartlip First Nation	-	-	-	-	-	Low	-	Rated low in 2002 & 2008. Resample in 2025.
3138 (Brentwood Bay, north of boat ramp)	36	Tsartlip First Nation	High	High	-	**High**	Low	Low	-	Rated high between 2004-2013 due to zinc. Tsartlip replaced pipes. Resample in 2025.
3146 (Brentwood Drive)	36	Central Saanich	-	-	-	-	Low	-	-	Rated low in 2006, 2007. Resample in 2024.
3148 (Brentwood Bay)	36	Central Saanich	-	-	-	Low	-	-	-	Rated low in 2000, 2005, 2010 & 2011. Resample in 2023 to monitor for change.
3153 (Brentwood Bay)	37	Central Saanich	-	-	Moderate	-	-	-	-	Elevated levels of Zn but rated moderate because the sediment is pumped out. U/S: in 2008 & 2009, station 3153-1 rated low. Remedial action undertaken, confirm sediment is still being removed.
3154 (Tod Creek)	43	Central Saanich	Low	-	Moderate	-	-	Low	-	U/S: station 3154-1 rated low. As, Cd, Cu, Pb, Zn elevated above CCME ISQG at mouth. Resample in 2022 to monitor for change.

Notes:
POD = Point of discharge; U/S = upstream
CCME = Canadian Council of Ministers of the Environment
ISQG = Interim sediment quality guidelines
U/S = upstream

Table notes on next page.

Table 4, continued

Notes:

Concentrations are in mg/kg dry weight

Samples are collected at the point of discharge to marine unless otherwise stated.

LPAH and HPAH are low and high molecular weight polycyclic aromatic hydrocarbons, respectively

CCME = Canadian Council of Ministers of the Environment

ISQG = interim sediment quality guideline; concentrations above this level but below the PEL will occasionally result in adverse effects on aquatic life

PEL = probable effects level; concentrations above this level will frequently result in adverse effects to aquatic life

Vancouver Island Background Concentrations are regional estimates (95th percentiles) from BC ENV; https://www2.gov.bc.ca/assets/gov/environment/air-land-water/site-remediation/docs/protocols/protocol_4.pdf

"-" means no guideline available

XX	Light yellow; italicized values are those that exceed a guideline but are below the Vancouver Island background concentration
XX	Value is greater than or equal to the CCME ISQG
XX	Value is greater than or equal to the CCME PEL

Table 5. 2021 Stormwater Aqueous Metals Concentrations on Saanich Peninsula

Table notes on next page.

Table 5, cont'd

Notes:

TOT = total state; DIS = dissolved state

British Columbia approved and working water quality guidelines for protection of freshwater or marine aquatic life were used for comparison

Although aquatic life guidelines would not apply to stormdrains, as they are not viable habitat for aquatic life, these comparisons indicate potential impacts to the marine environment

a hardness of 100 mg/L CaCO3 was used to calculate hardness dependant water quality parameters

1 Interim guideline

2 Cr (IV) / Cr (III)

3 guideline If methylmercury is 5% of the total mercury; methyl mercury was not measured in these samples

xx	value exceeds the provincial guideline for protection of freshwater aquatic life
xx	value exceeds the provincial guideline for protection of marine aquatic life
xx	value exceeds the provincial guideline for the marine and freshwater aquatic life
xx	italicized value exceeds a guideline which is only partially applicable. Further investigation is needed.

Table notes on next page.

Table 6, cont’d

Notes:

Concentrations are in µg/L

PAH = polycyclic aromatic hydrocarbons

HMW = High Molecular Weight, LMW = Low Molecular Weight

Guidelines are BC ENV for protection of aquatic life maximums. The freshwater guideline is a chronic guideline.

The guideline for methylated naphthalene was used for 1-methylnaphthalene and 2-methylnaphthalene

[1] The guideline for pyrene is based on a phototoxic exposure

No values exceeded a guideline

Table Notes on next page

Table 1, cont'd

Notes:

Where values were not detected, statistics were calculated using the detection limit.
BC ENV approved water quality guidelines for protection of freshwater aquatic life applied unless otherwise stated.
Minimum average hardness (61.6 mg/L as $CACO_3$) was used to calculate hardness-dependant water quality guidelines for screening purposes.
Samples that exceeded the minimum guideline were highlighted to be assessed further based on the sample hardness.
DIS = dissolved state, TOT = total state.
NTU = Nephelometric Turbidity Unit
Summer samples were all collected during dry weather and the fall samples were collected during or after recent heavy rainfall.

1 BC ENV working water quality guideline.
2 Hardness-dependant; max (e[1.03 * ln(Hss) - 5.274]) ranges from 0.19 to 0.65 µg/L Cd; average (e[0.736 * ln(Hss) - 4.943]) ranges from 0.11 to 0.30 µg/L Cd
3 Cr(IV) / Cr (III)
4 Site specific BC Biotic Ligand Model acute and chronic guidelines for dissolved copper were calculated for each sample. There were no exceedances of the acute guideline, but each sample was also compared to the chronic guideline.
Goldstream River guidelines ranged from 0.4 to 2.3 ug/L for acute and 0.2 to 0.4 µg/L for chronic.
If 1 of 5 samples or average of the 5 samples exceed chronic guideline, station has exceeded.
5 Minimum values for dissolved oxygen.
6 Average guideline is a geomean of 400 CFU/100 mL for E. coli; E. coli values in the average row are geomeans.
7 If hardness > 8 mg/L : e(1.273 ln (hardness) - 1.460; if hardness < 8 mg/L : 3 ug/L total lead; if mean hardness > 8 mg/L CaCO3 then, 3.31 + e(1.273 ln (mean hardness) - 4.704) ug/L total lead.
8 0.01102 hardness + 0.54 maximum mg/L total Mn; 0.0044 hardness + 0.605 average mg/L total Mn.
9 25 ug/L total Ni if hardness is < or = 60 mg/L $CaCO_3$, 110 ug/L Ni at hardness > 60 to 180 mg/L as $CaCO_3$, 150 ug/L Ni at hardness of 120 to 180 mg/L as $CaCO_3$
10 Draft Vancouver Island Objective, applies to monthly samples collected June to September; our data was collected 5 times in 30 days.
11 Optimum pH range
12 0.1 ug/L Ag max, 0.05 ug/L Ag ave if hardness is <=100 mg/L; otherwise 3 mg/L Ag max, 1.5 mg/L Ag ave.
13 Draft objective proposed to protect juvenile Coho (the most sensitive species); average weekly temperature at any location in the creeks.
14 25 and 5 mg/L over ambient levels of 2 mg/L in the upper Sooke River watersheds.
15 Max: 9 NTU (8 NTU above ambient levels in the upper Sooke River watershed) at any time during clear flow periods, and average 3 NTU (2 NTU above ambient levels during clear flow periods).
16 If H is >90 mg/L then 33 +0.75 (hardness-90); if H is less < or = 90 mg/L then 33 ug/L or 0.033 mg/L; if H is >90 then 75+0.75(hardness-90); if less < or = 90 then 7.5 ug/L or 0.0075 mg/L.

xx value exceeds the provincial guideline protective for aquatic life.

xx italicized value exceeds a guideline/objective which is only partially applicable. Further investigation is needed.

APPENDIX G

CRD Public Health and Environmental Concern Rating System

STORMWATER DISCHARGE RATING SYSTEM

The Capital Regional District (CRD) evaluates stormwater discharges for public health and environmental concerns using a rating system for stormwater discharges developed by the CRD titled *Stormwater Discharge Rating System for the Capital Regional District* (Drinnan, 1997). As part of the rating system, the following study was used to determine levels of public use, coastline habitat sensitivity and flushing characteristics of the marine receiving waters:

- *An Evaluation of the Coastline Sensitivity Associated with Stormwater Discharges on the Saanich Peninsula (Drinnan, 1997)*

Public shoreline use ratings indicate the potential for public contact with stormwater. These ratings were updated in 2010.

The rating of discharges allows the jurisdictions involved to better manage limited funds and undertake remedial measures where necessary. A copy of the rating system and the coastline sensitivity evaluations are available upon request from the CRD. A brief explanation of the stormwater discharge rating system follows.

1.1 Public Health Concern

CRD staff rate each discharge as a high, moderate or low level of concern for public health based on the level of bacterial contamination in the stormwater and the potential for human contact. The parameters used to assess the level of concern for public health are:

- Escherichia coli (*E. coli*) concentrations in the stormwater discharge
- discharge flow rate
- location of the discharge (e.g., below high-water line)
- public use of the shoreline (uses such as swimming, fishing, or kayaking)

The level of contamination is used to assign a bacterial rating. Public shoreline use ratings are used to indicate the potential for public contact with stormwater and depends on the type of activities carried out on the shoreline. Table 1 shows criteria for the bacterial and public shoreline use ratings.

Table 1 Fecal Coliform and Public Shoreline Use Rating Criteria

Rating	Bacterial Rating Criteria	Rating	Public Shoreline Use Rating Criteria
1	No flow measured or *E. coli* count consistently under 200 CFU/100 mL	1	Low contact (e.g., inaccessible, beach walking)
2	*E. coli* count between 200 and 5,000 CFU/100 mL	2	Secondary contact (e.g., kayaking)
3	*E. coli* count greater than 5,000 CFU/100 mL	3	Primary contact (e.g., swimming, scuba diving)

Note: *E. coli* counts above 200 CFU/100 mL (on average) indicate the potential to cause adverse public health effects from primary recreational activities such as swimming or diving.

1.2 Environmental Concern

Environmental concerns are based on a contaminant rating of discharge sediments. The contaminant rating is determined by comparing the sediment concentration of each of eight metals and two groups of organic contaminants (Cn) with the CRD Marine Sediment Quality Guidelines (MSQG) to obtain a ratio (Cn/MSQG). To account for potential additive effects, these ratios are summed to calculate the toxic equivalent unit (TEU). Table 2 provides the criteria for determining the contaminant rating.

Table 2 Criteria for Determining the Contaminant Rating

Contaminant Rating	Criteria for Determining the Contaminant Rating
Low	Sum of the individual ratios of Cn/MSQG (TEU) is less than 1.0
Moderate	Sum of the individual ratios of Cn/MSQG (TEU) is greater than or equal to 1.0, but no individual parameter exceeds, or is equal to, a value of 0.75
High	The ratio Cn/MSQG is greater than, or equal to, 0.75 for any single parameter

Discharges evaluated are located near environmentally sensitive areas, in creeks or near heavily settled areas where there is an increased probability of pollution. All discharges sampled for environmental concern are sampled for at least two years to confirm the contaminant concentrations and contaminant(s) of concern. Only a small number of discharges can be sampled each year due to budgetary constraints; therefore, each discharge selected for sampling can only be sampled once per year.

Discharges with a confirmed high contaminant rating are investigated to determine the source(s) of contamination. The priority in which high-rated discharges are investigated and problems mitigated is determined by calculating a habitat rating (high, moderate or low). The habitat rating is based on the habitat sensitivity, discharge flow and marine flushing characteristics. The following briefly describes the rating criteria for the habitat rating.

Table 3 Criteria for Determining Ratings for Habitat Sensitivity, Discharge Flow and Marine Flushing

Habitat Sensitivity Rating		Discharge Flow Rating		Marine Flushing Ratings	
Rating	Criteria	Rating	Criteria	Rating	Criteria
1	Low productivity; less diverse habitats	0.5	Less than 50 L/minute	0.5	Open shoreline; high flushing
2	Moderate productivity; diverse habitats	1	Between 50 to 500 L/minute	1	Partially enclosed area; moderate flushing
3	High productivity or endangered or protected habitats	1.5	Greater than 500 L/minute	1.5	Enclosed area; poor flushing

These three ratings (habitat sensitivity, discharge flow and marine flushing) are summed to determine a habitat rating as shown in Table 4. The habitat rating assigned to each discharge will allow limited resources to be spent in a prioritized manner.

Table 4 Criteria for Establishing the Habitat Rating

Habitat Rating and Mitigative Priority	Sum of Criteria (Habitat + Flow + Flushing)
Low	2.0-3.0
Moderate	3.5-4.5
High	5.0-6.0

OTHER CONCERNS

There are a number of other concerns that have been jointly reviewed and discussed by staff from the CRD and the other jurisdictions involved. This review and discussion assists in setting priorities for remediation of discharges with a high level of concern for public health and the environment. These include:

- the cost of remediation
- the likelihood that remediation will be successful
- compatibility with the priorities of the jurisdictions
- public interest
